Type of
tracks

260.000

250.000

240.000

230.000

Type

The special cold rolled monorail tracks are available in 4 sizes, each is indicated by 6 figures:

230.000, 240.000, 250.000 and 260.000 .

The standard lengths are 6 m. Intermediate lengths are also available. In a monorail project all tracks are cut to the exact dimensions.

Execution

The tracks can be supplied in three different finishes:

1. The track is painted and not drilled.

In this case the second series of 3 figures is indicated by: ...000...

2. The track is painted, drilled and tapped (at both sides) for a jointing bracket. In this case the second series of 3 figures is indicated by: ...100...

3. The track is painted, drilled and tapped (at both sides) for a connecting piece. In this case the second series of 3 figures is indicated by: ...300...

Identification

The tracks are indicated by a number of 9 figures.

The first series of 3 figures indicates the track type: 250... ..

The second series of 3 figures indicates the finishing:... 100 ...

The third series of 3 figures indicates the length: 300

Example of order

The type of track is 250.000_____250_____100_____300

The track is painted, drilled and tapped for a connection_____

The length of the track is 3 m_____

Finish

In the standard execution the tracks are supplied with an orange premium finish coating RAL 9006. The tracks can be supplied in other colours.

By request the tracks can be supplied galvanized (hot dipped), metallized or with an epoxy coating.

In Addition

The tracks type 230.000 and 240.000 are also available sendzimir galvanized. In this case the second array of three numbers is indicated by: ...001... .

Static Loading

Static load F_s with deflection $f = 1/400 \times X_s$ or $f = 1/500 \times X_s$ and a max. deflection stress of 1000 kg/cm^2 , taking into account the deflection due to the track's own weight.

In the table are some practical values of the maximum carrying capacity F in kg and for the equally divided load Q in kg/m as a function of the distance between brackets Xs in mm.

These values apply for monorail applications.

Distance between brackets = Xs	230.000		240.000		250.000	
	F	Q	F	Q	F	Q
500	—	—	—	—	1800	1800

4000	15	7	40	15	100	40
4500	—	—	25	8	70	25

Remark

In general a monorail system is fixed with the brackets to a steelwork consisting of IPE-girders.

While calculating the steelwork, it is very important to respect an f max according to the application:

f max < 1/400 for monorails in single straight tracks

f max < 1/500 for monorails in the stock areas of the circuit

Please contact our engineering department for applications with heavy impact loads, or in the case of F or Q > 1000 kg (/m).

The standard track bends in a monorail system are supplied with a radius from 310 mm up to 1200 mm.

On request the track bends can be manufactured with an other radius.

The standard track bends are provided at both ends with a straight piece of track in order to ensure a perfect joining to the following straight track.

We have various vertical bends available in our program as well.

Angle	Radius in mm	Series 230.000	Series 240.000	Series 250.000	Series 260.000
90°	310	230.010	240.010	250.010	260.010

90° lengthened	310	230.150.903.1	240.150.903.1	250.150.903.1	260.150.903.1

General

The track bends with a radius up to and including 600 mm are provided with a vertical and drilled suspension plate. The track curves with a radius larger than 600 mm are fastened with clamps and standard brackets to an I-girder of the support steelwork.

Suspension Piece Type A

The suspension piece type A is welded to the support steelwork and is applicable for track curves with a radius up to and including 600 mm.

Suspension Piece Type B

The suspension piece type B is clamped to support steelwork executed in IPE-girder 120 up to and including IPE 270 and is applicable for track curves with a radius up to and including 600 mm.

In Addition

The lengthened track curves 90° are fastened to an I-girder of the steelwork with 2 pairs of standard clamps.

All switches are fitted with movable, load bearing tongues.
The switch mechanism is mechanical and is operated by a chain. For the standard mechanism the pull chain is located at 500 mm from the monorail.
On request a lengthened mechanism can be supplied so that the pull chain is suspended further from the track.

Executions of the RAILTECHNIEK switches

The switches are schematically indicated in top view. For the standard execution of the 2 way switches the pull chain for the operation of the switch mechanism is suspended to sideways the straight track. On request the pull chain can be suspended sideways to the track curve.

Code:...../002

(except for Y-switches)

Remark

The track switches also can be fitted out with a pneumatic or electrical switching device for farther information please talk to our application engineering department

Pneumatically Operated Switches (... ../009)

Special Switch Operations

The pull mechanism of these 2 way switches is replaced by a specially adapted mechanism.
As the trolley itself operates the switch, this kind of switches does not need the operator intervention.

Switch without operation (... ../003)

Spring operated switch (... ../007)

Is used when the load is always transferred in the direction of the indicated arrows (see figure)
Codification ...003
E.g. 250.520/003

The load carrying direction tongue of this two way switch is held in a predetermined position by a spring mechanism. The spring mechanism is easy to reverse which makes it possible to choose between the running a or b (see figure)
Code .../007 Ex. 250.520/007

Switch Combinations

Turntable

The operation of a turntable can be either pneumatic or electric
(Please contact our engineering department for the latter case).

The turntable can only be operated without a trolley in the turntable.

230.730
240.730
250.730

Switch/Turntable Combination

A turntable is commonly used in combination with switches. In order to ease the mounting of these combinations, the use of the switches as follows on is strongly recommended, because of their specially adapted overall dimensions.

2*0.537 right
2*0.547 left

2*0.687

- 2 way switch 45° left	2*0 734
- 3 way switch	2*0 738

3 Way Switch With Special Switch Operating Device

This 3 way switch is composed of a combination of switches with different functions.
e.g. A 3 way switch may be composed of a switch without operation and of a second one spring operated.

As this 3 way switch is composed of two separate working switches the function is indicated with a identification number of 5 figures which follows the order number of the switch.

The first three figures of the codification refer to the mechanism of the right switch and the last two figures of the identification number refer to the mechanism of the left switch.

The reference is for instance : 250.607/00307

This is a 3 way switch 2 x 90° of which the switch without operation is the right one and the

Switches With Lengthened Pull Chain

The switches are fitted out with a lengthened pull chain in case of transport of large loads.
In this execution the pull chain is suspended at 1 m from the monorail.

Identification number:

e.g.: - Standard switch - with lengthened pull chain: 240.510.005
 - Y-switch - with lengthened pull chain left: 240.620.005
 - Y-switch - with lengthened pull chain right: 240.620.006

The use of loadbars allows the transport of several products together. A loadbar consists of a flightbar with a buffer on both sides. The single or double trolleys are mounted on fixings that are welded on the crossbar at a distance equal to the parallel track width in the monorail circuit. These fixings ensure that **pendant** connections between the trolleys and the loadbar are kept constant, in order to avoid excessive wearing of the curves and the track switches.

Trolley

	trolley	A	B	C

	254.040.001			215

Instructions for use

The brackets are subdivided in to standard and joining brackets.

A standard bracket is used as suspension point for the track.

A joining bracket is used as suspension point where two tracks are joined.

A monorail installation can be mounted directly to a ceiling (subject to the ceiling strong enough) or to a horizontal mounting face.

If switches are applied in an overhead runway a headroom of 60 mm should be provided.

Finishing: electro galvanised

The interruption of a monorail is often necessary in the case of fire proof doors, sliding doors for ovens, locking devices for unloading areas, roller shutters, guillotine doors, etc.

The built-in security guarantees that the monorail interrupter cannot open in the instance where a trolley is inside the unit.

A left or a right turning operation is available.

Execution

Mechanical or pneumatic operation is available.

Mechanical Operation

In case of mechanical operation the sliding door opens the interrupter.

The closing of the interrupter is by a spring mechanism.

The track length "L" is determined as a function of the door thickness "D"

A specific door thickness corresponds with a 4 digit code, which follows the order reference.

Door thickness	Code
0 to 50	0050
50 to 80	0080
80 to 125	0125
125 to 170	0170
170 to 200	0200

Pneumatic
Operation

In this case the interrupter is opened by a pneumatic cylinder.
The track length is standard executed with L= 550 mm. In open position the
free passage is 320 mm

General

This device is used for applications where the track can expand e.g. safety tracks or ovens. The expansion device is composed of a special bracket with tracks finished at one side as indicated by the drawing.

According to the fastening possibilities the following options are available.

To calculate the number of expansion devices one should take into account that for each expansion device the maximum expansion is 20 mm. The expansion devices are mounted with the maximum opening so that the tracks can expand in case of temperature increase.

Expansion Ceiling Mounted Bracket

End Cap With Buffer

The end cap with buffer is used in combination with a trolley of a hoist or when the trolley should run to the end of the monorail. The rubber buffer can be adjusted according to the type of trolley running in the monorail.

End Cap With Connecting Box

This end cap is provided with a connecting box for flat and flexible electric cables and with fixing holes for the fastening of a cable clamp.

General

Railtechnik developed a complete range of standard wheelsets to which a specific item such as a bolt, a hook etc... fits according the application. All wheelsets are mounted on ball-bearings. The wheels are working independently and are mounted two by two (bogie arrangement). Depending on the application there is the choice between 2-wheeled, 4-wheeled or 8-wheeled trolleys. All trolleys can rotate on their vertical axis (except series550). The trolleys are also provided with vertical guides in order to avoid the overturning and to assure a perfect guidance during the translation. The standard trolleys are fitted for temperatures of maximum 100 °C. In case of working conditions up to 150 °C or up to 300 °C, the trolleys are mounted on special high temperature ball bearings.

The code of the trolleys changes according to the working conditions : e.g. :

	Up to 100 °C	Up to 150 °C	Up to 300 °C
Ref.	244 010/1	243 510/1	243 010/1

Carrying capacity of the trolleys

In the tables the maximum carrying capacity 'F' is indicated.

In order to calculate the carrying capacity F, the real net load has to be increased with the operating coefficient and the temperature coefficient 'y'.

$$F = F_n \times x \times y$$

Remark:

The maximum admissible carrying capacity "F" of the trolleys is indicated in the tables with operating coefficient $x=1$ and temperature coefficient $y=1$.

Note:

The maximum temperature for trolleys with nylon wheels is 80 °C.
Finishing: electro galvanized

OPERATING COEFFICIENT

Kind of operating	Coefficient
I. Very moderate use, no shock or impact load (e.g. the daily transfer of a load along some meters)	1
II. Normal use, very light shock or impact load (e.g. automatic equal motion with a speed of max. 10 m/min., motion time of the trolleys up to 20 % max.)	1.21
III. Frequent use, light shock or impact load (e.g. manual motion with unequal speed, motion time of the hangers 20 to 50 %).	1.33
IV. Very frequent use, shock or impact load (e.g. continuous working automatic installations, motion time of the hangers 50 to 100 %)	2

TEMPERATURE COEFFICIENT y

Temperature	Temperature coefficient y
15 à 100 °C	= 1
à 150 °C	= 1.05
à 200 °C	= 1.15
à 225 °C	= 1.25
à 250 °C	= 1.35
à 275 °C	= 1.50
à 300 °C	= 1.70

With a lift-lower device often called a dropsection, goods can be lifted or lowered to a man's working height; this allows the track to be installed at a higher level.

In the loading and unloading area goods can be easily handled.

A lift-lower device can be incorporated in either new or existing installations.

Lift-lower devices are also used to immerse loads.

The problem of different levels in a circuit can be solved: for special applications lift-lower devices with a vertical guide system can be installed.

The lift-lower devices are standardized for lifting capacities of 250 kg and 500 kg. On request options for 1000 kg are available.

A lift-lower device is manufactured such that the lifting device is mounted on to the supporting structure. This supporting structure is integrated in the steelwork of the monorail circuit. Installation is by bolted flange plates directly to the support structure.

Lift-Lower Devices

Load	Series	OVERALL DIMENSIONS		
		A	B	C
250 kg	230.000	1000-1500-2000-... per 500mm	A+ 165	A+ 500
	240.000	1000-1500-2000-... per 500mm	A+ 172	A+ 500
	250.000	1000-1500-2000-... per 500mm	A+ 192	A+ 500
	2*0.000	750	942	1500
500 kg	240.000	1000-1500-2000-2500-... per 500mm	A+ 194	A+ 500
	250.000	1000-1500-2000-2500-... per 500mm	A+ 194	A+ 500

Options:

- Pneumatic locking devices with control switch (pneumatic locking devices are necessary when several trolleys are positioned at the same time in the lift-lower device track)
- Connecting voltage: 400VAC 3p+N+PE, 0.75kW
- Spring-controlled positioning switch
- Alternative lifting speed (up to 10 m/min)
- Lifting height > 3,5 m
- Adjustable speed
- Detection of the trolley or the crossbeam in the lift-lower track; in this case the trolley or crossbeam is provided with a detection plate.
- EX- execution: Exd. engine, explosion-proof control device, electric box with intrinsically safe electrics (In this case the electric box should be placed outside the Ex-zone).
- Positioning device to stop the trolley in the center of the lift-lower device track.

Lift-lower devices of 1000 kg are only manufactured on request according to the specific demands of the customer.

Coupled Lift-Lower Devices

Two lift-lower devices can be coupled electrically so that both devices are controlled from one single control box and operated with one single manual pendant control.

Sideways Lift-Lower Devices

A cross lift-lower device is composed of two standard lift-lower device mounted in parallel

2 Lift-Lower Devices In Sequence

Extended Lift-Lower Devices

These extended lift-lower devices are used in a circuit where a long flightbar is used. In this case the flightbars are provided with a detection plate so that the lift-lower device only can be operated if the flightbar is correctly positioned in the track of the lift-lower device.

Zone detection on both sides of the lift-lower device also can be provided, in order to avoid collision of the flightbars while operating the lift-lower device.

Please contact our engineering department.

A = length of lift-lower device track
B = overall dimension of monorail track
C = overall dimension of supporting structure

An end lift-lower device consists of a track of 1 meter and a hinged track of length "L" = (see table).
With a hoist or a compressed air cylinder the hinged track can be lifted. A safety device automatically locks the track.
The length "L" has to be communicated when ordering.

Positioning Lift-Lower Devices In a Circuit

- 1. standard lift-lower device
- 2. coupled lift-lower devices in sequence
- 3. cross lift-lower device
- 4. end lift-lower device

In a monorail circuit a bridge crane can be mounted in order to allow the trolleys to run in parallel mounted tracks: e.g. in baking ovens or sorting areas. The bridge crane can be coupled mechanically or pneumatically.

Railtechniek have developed several systems which can be applied according to the specific need like a simple powered conveying chain or a walking beam to provide automatic feed or automatic buffering.

Our sales department can inform you about the many different standard solutions developed by Railtechniek for numerous applications.

For automatization of manual monorail systems there are various options available.

Transportation is done by use of a transfer, a chain with pusher dog running next to the monorail and pushing a loadbar.

This is a cost efficient way for transportation through a spraybouth for example or the return line of empty carriers while keeping the rest of the system manual and not lose flexibility.

Railtechnik standard Teleflex D8 transfers which can be used in near endless situations applies due to its modular components.

Basic transfer example:

	Description	Code	Symbol	Remark
1	Drive wheel 8T	802.400		Type 1 = 0.25-1.9 m/min Type 2 = 1.9-14.9 m/min Type 3 = 0.8-6 m/min

Pusher dog can be mounted every 406.4 mm

Railtechnik manufactures a large range of bridge cranes.
Please ask for the separate catalogue.

Railtechnik manufactures a large range of tracks with adaptor brackets and clamps for cable guidance.

Cable guidance applies for flat as well as for tubular flexible cable. Compressed air lines are hung on specially adapted trolleys.

Please ask for the separate catalogue.

-For an effective runway of the trolley (L_n) > 30 m the values of n and LK are calculated as follows:

- $n = \frac{L_n \times C}{2 \times A} - 1$ n = number of cable guidance trolleys A: Loop height C: Coefficient

Height of the loop (m): A	0.5	0.63	0.8	1.0
Coefficient C	1.1	1.08	1.065	1.05

$$L_k = L_t \times 1.1 + 2 \text{ m}$$

$$L_t = L_w + L_v$$

$$L_w = L_n + B$$

$$L_v = n \times w$$

LK : Cable length

LT : Total length of the track

Lw : Length of the runway

B : Width of the trolley

Lv : Required space for the cable guidance trolleys

w : Width of the cable guidance trolley

Who is RAILTECHNIEK?

Railtechniek van Herwijnen BV is an independent global company, specializing since their foundation in 1983 in the production and installation of Overhead Conveyors components and systems. The company designs, manufactures and installs only under international approved standards.

For ancillary equipment such as electric switches, pneumatic, PLC's, bearings etc. we only use international suppliers who can meet with our standards. After the completion and sign off of the system by the customer a fully detailed manual inclusive of maintenance and operation instructions is supplied. After sales service & maintenance contracts are offered (subject to a separate contract). All PLC control systems use a modem connection with our 24-hour helpdesk. This is included as standard.

Our European subsidiaries:
